rtboxdesign

- **Drupal make** - initial install and configuration of Drupal 7
- **Core template** - set up the core theme template to utilize previous code. (This will take longer as the code is currently in html tables).
- **Set up menu system** - recode the menu javascript and css to work correctly with Drupal's menu system.
- **Contact page** - custom contact page set out like current contact/enquirers page.
- **Transfer current one-page content** - upload all pages that do not require a content type.
- **Set up Product section and taxonomy** - custom content type and taxonomy categorization for products.
- **Transfer current product content** - all product information and assets uploaded.
- **Configure and test SMTP** - set up SMTP module to function with clients mail account (Will need the info on this by launch date).
- **Configure Administration panel** - set up a user account for the client with limited permissions so they can edit only required information but not anything risky.
- **Final Launch** – upload to production server, final link test.

**Project Quote: \$440**
